# A Study of Reflow Engines

Reflow engines reconstruct the reading order of two column academic papers.

Second paragraph starts here after a clear vertical gap.

Right column line one alpha.
Right column line two beta.
Right column line three ends.

Page two left column text
continues the document body
with several more lines.
Fourth line keeps it wide.
Fifth line of the column.
Sixth line ends the block.

Page two right column text
also continues nicely and
keeps the gutter intact
with enough total lines
for two column detection
to engage as expected.

Page three tests the hy-
phenation join behavior
across a broken word.
Another line here.
And one more line.
Final left column line.

Page three right column
carries simple body text
to balance the layout
and reach the required
line count for the
detection heuristic.
